The actual flow is dependent upon electrical command signal and valve pressure drop. The flow for a given valve pressure drop can be calculated using the square root function for sharp edge orifices:

\[ Q = Q_N \sqrt{\frac{\Delta p}{\Delta p_N}} \]

- \( Q \) [gpm] = calculated flow
- \( Q_N \) [gpm] = rated flow
- \( \Delta p \) [psi] = actual valve pressure drop
- \( \Delta p_N \) [psi] = rated valve pressure drop

Principle of operation

An electrical command signal (flow rate set point) is applied to the torque motor coils, and creates a magnetic force which acts on the ends of the pilot stage armature. This causes a deflection of the armature/flapper assembly within the flexure tube. Deflection of the flapper restricts fluid flow through one nozzle which is carried through to one spool end, displacing the spool.

Movement of the spool opens the supply pressure port (P) to one control port, while simultaneously opening the tank port (T) to the other control port. The spool motion also applies a force to the cantilever spring, creating a restoring torque on the armature/flapper assembly. Once the restoring torque becomes equal to the torque from the magnetic forces, the armature/flapper assembly moves back to the neutral position and the spool is held open in a state of equilibrium until the command signal changes to a new level.

In summary, the spool position is proportional to the input current and with constant pressure drop across the valve, flow to the load is proportional to the spool position.
**Operating Pressure**
- ports P, T, A and B up to 3,000 psi

**Temperature Range**
- Fluid: -40° to 275°F
- Ambient: -40° to 275°F

**Seal Material**
- Viton others on request

**Operating Fluid**
- Compatible with common hydraulic fluids, other fluids on request.
- Recommended viscosity: 60-450 SUS @ 100°F

**System Filtration**: High pressure filter (without bypass, but with dirt alarm) mounted in the main flow and if possible, directly upstream of the valve.

**Class of Cleanliness**: The cleanliness of the hydraulic fluid greatly affects the performance (spool positioning, high resolution) and wear (metering edges, pressure gain, leakage) of the servovalve.

**Recommended Cleanliness Class**
- For normal operation: ISO 4406 < 14/11
- For longer life: ISO 4406 < 13/10

**Filter Rating**
- recommended
- For normal operation: β₁₀ ≥ 75 (10 µm absolute)
- For longer life: β₁₀ ≥ 75 (5 µm absolute)

**Installation Operations**
- Any position, fixed or moveable.

**Vibration**
- 30 g, 3 axes

**Weight**
- 2.0 lb (0.9 kg)

**Degree of Protection**
- EN50529P: class IP65, with mating connector mounted.

**Shipping Plate**
- Delivered with an oil sealed shipping plate.

---

**Valve Flow Diagram**
Valve flow for maximum valve opening (100% command signal) as a function of the valve pressure drop.

* Measured at 1,000 psi pilot or operating pressure

**Typical characteristic curves** with ±40% and ±100% input signal, measured at 3,000 psi operating pressure.
The mounting manifold must conform to ISO 10372-03-03-0-92. Surface to which valve is mounted requires a \( \Delta \) finish, flat within 0.002[0.05] TIR.

**For External Null Adjust:** Flow out of Port B will increase with clockwise rotation of null adjust screw (1/8 hex key).

**For External Null Adjust:** Flow bias is continually varied for a given port as the null adjust is rotated.

**Rated current and coil resistance**
A variety of coils are available for 771/2/3 Series Servovalves, which offer a wide choice of rated current. See Table 1.

**Coil connections**
A four-pin electrical connector (that mates with an MS3106F14S-2S) is standard. All four torque motor leads are available at the connector so external connections can be made for series, parallel or differential operation.

771/2/3 Series Servovalves can be supplied on special order with other connectors or a pigtail.

**Servoamplifier**
The servovalve responds to input current, therefore, a servoamplifier that has high internal impedance (as obtained with current feedback) should be used. This will reduce the effects of coil inductance and will minimize changes due to coil resistance variations.
