1 Introduction

This user manual is a extension to the

User Manual

M3000® Control System
Control System
MSC (Moog Servo Controller)
Control Module

Pay attention to the chapters „General Information“ and „Safety Instructions“ of this user manual.
2 Short Description

2.1 General
The QAIO 2/2 analog module is used for local extension of the inputs and outputs (I/O) of the Moog Servo Controller (MSC) control module. The analog levels are identical to the levels of the MSC. The module is mounted on a DIN top-hat rail and directly connected to the MSC via the internal extension bus (E-bus).

2.2 Features
Analog I/O extension module with pulse input.
- 2 analog inputs
- 2 analog outputs
- 1 reference voltage output +10 V
- Pulse input
- Connection via E-Bus

2.3 Outputs/Inputs
- 2 analog inputs, each configurable in the MACS development environment as ±10 V, ±10 mA or 4-20 mA. The inputs are converted in multiplex operation.
- 2 analog outputs, each ±10 V, additionally individually configurable in the MACS software as ±10 mA, ±50 mA or 4–20 mA with wire fault monitoring
- 1 reference voltage output
  The reference voltage source provides a short circuit protected voltage of +10 V.
- 1 pulse input 24 V useable as counter input or frequency measurement input

2.4 Module Status LEDs
On the front, 4 LEDs provide information about the status of important module functions.

2.5 Configuration
The configuration of the analog I/O is carried out per software via the central control configuration in the Moog Axis Control Software (MACS) development environment. Either the two analog inputs or the pulse input can be used.

2.6 Actuation
The I/O of the analog extension module is actuated directly from the MSC (not D136X001-001 and D136E001-001) via the extension bus (E-bus). All input- and output-data are transferred within one cycle of the E-Bus. Therefore the module suits perfect for fast control tasks.

2.7 E-Bus
One MSC can be extended with a maximum of 7 QAIO 2/2 modules. It is not possible to combine it with QAIO 16/4 on one E-Bus segment.

### Standards
- Operating equipment demands and examinations: IEC 61131-2
- Interference emission / immunity: EN 61000-6-4 / EN 61000-6-2, industrial part
- Shock / vibration: IEC 60068 part 2-27 / IEC 60068 part 2-6
- Protection class / protection system: III / IP20
- Insulation strength: IEC 61131-2; test voltage 500 V DC

### Energy Supply
- Voltage supply of module electronics: +24 V DC (18-32 V DC) SELV pursuant to DIN EN 60950-1
- Current consumption of module electronics: max. 0.25 A
- Potential separation: Separate potentials for: module electronics, 24 V energy supply, pulse input
- Internal voltages: Internally generated via DC/DC converters
- Protection against reverse polarity: Yes

### Analog Inputs
- 2 analog inputs: 16 Bit; individually configurable in the MACS development environment as ±10 V, ±10 mA or 4–20 mA; overvoltage protection up to ±36 V

### Analog Outputs
- 2 analog outputs: 16 Bit; each ±10 V, additionally individually configurable in the MACS development environment as ±10 mA, ±50 mA or 4–20 mA. Overvoltage protection up to ±36 V; short-circuit protected

### Reference for sensors
- Reference voltage output: +10 V; max. load: 5 mA. Overvoltage protection up to ±36 V; short circuit protected
### Pulse input

| Pulse input | 24 V digital input can be used as input pursuant to IEC 61131-2 type 1 positive switching (input OE) or ground switching. Either the two analog inputs or the pulse input can be used. |

4 Analog Outputs

4.1 Basic Wiring Diagram

![Basic Wiring Diagram of an Analog Output of the MSC](image)

Figure 56: Basic Wiring Diagram of an Analog Output Aox of the MSC (when Used as a Voltage and Current Output)

4.2 Specifications

Number of analog outputs
2

Analog output type
Voltage output ±10 V nominal

Additionally one current output each:
configurable as: ±10 mA, ±50 mA or 4–20 mA (each nominal)

The analog outputs are configured in the PLC configuration of the MACS development environment.

Output impedance within nominal signal range
<0.2 W (voltage output)
Approx. 1 MW (current outputs)
Greatest error over the entire temperature range
±1 % of full scale value

Output ranges

Output Ranges of QAIO 2/2 Analog Outputs

Digital resolution
16 bit

Data format in the application program
32 bit floating point

Load impedance range
Voltage output ±10 V: ≥ 1.000 Ω
Current output ±10 mA: ≤ 1.000 Ω
Current output ±50 mA: ≤ 200 Ω
Current output 4–20 mA: ≤ 500 Ω

The load impedance range of the current output 4–20 mA does not comply with IEC 61131-2. (IEC 61131-2 requires a load impedance range of ≤ 600 Ω.)

Update time
The update time corresponds to the task interval of the application program that actuates the output.

The task interval (and thereby the update time of the outputs) is set in the task configuration of the MACS development environment.

<td></td>
</tr>
</tbody>
</table>

Rise time T₁₀/₉₀ of QAIO 2/2 Analog Outputs

Protection
Continuous short-circuit protection; overvoltage protection up to ±36 V

Short-circuit current Iₓ,max
Voltage output ±10 V: Iₓ,max = ±15 mA
Current output ±10 mA: Iₓ,max = ±10.92 mA
Current output ±50 mA: Iₓ,max = ±54.61 mA
Current output 4–20 mA: Iₓ,max = ±20.74 mA
Recommended cable types
Use only shielded cables.
The shield must be made of copper braiding with at least 80% coverage.
The wire must be made of copper with a cross section of at least 0.25 mm² (23 AWG).
In environments with a high amount of disturbance, use cables with twisted pair wires.

Calibration
The QAIO 2/2 is calibrated at the factory and does not require any additional calibration.

Permissible load types
Resistive load according to "Load impedance range"

- The stability of the current outputs is ensured up to an inductive load of 100 mH.
- The stability of the voltage outputs is ensured up to a capacitive load of 10 µF.

Output current of the voltage output
Max. 10 mA

Wire fault monitoring of the analog current outputs
The analog current outputs are monitored for wire faults. The status of the wire fault monitoring can be evaluated in the application program.

4.3 Reference Voltage Output

Reference voltage
+10 V DC

Load current
Max. 5 mA

Precision
±0.3 % of full scale value

Temperature coefficient
< 280 µV/K

Output impedance
< 0.2 Ω

Protection
Continuous short-circuit protection; overvoltage protection up to ±36 V

Short-circuit current
I_{max} = 15 mA (residual current of the terminals 91 (REF) and 100 (REF) of the connector X6)
5 Analog Inputs

5.1 Basic Wiring Diagram

![Basic Wiring Diagram of the Analog Inputs Ai1…Ai2 of the QAIO 2/2](image)

The upper analog input Aix is configured as a voltage input, the lower analog input Aiy as a current input.

An analog input Aix can only be used as a current input if the terminal Cxa is connected to the terminal Cxb.

Example: If Ai2 will be used as an analog current input, C2a must be connected to C2b.

Insertion bridges for connecting the QAIO 2/2 terminals Cxa and Cxb are available from Moog as accessories.

5.2 Specifications

Number of analog inputs
2

Type of analog inputs
Differential, configurable as: ±10 V, ±10 mA or 4–20 mA (each nominal)

The analog inputs are configured in the PLC configuration of the MACS development environment.

Common-mode properties
Common-mode rejection: > 85 dB
Common-mode voltage range: ±17 V

Input impedance within nominal signal range
> 100 kΩ on voltage inputs
200 Ω on current inputs
Greatest error over the entire temperature range
±0.5 % of full scale value

Permissible measurement range

<table>
<thead>
<tr>
<th></th>
<th>nominal</th>
<th>minimal</th>
<th>maximal</th>
<th>LSB value</th>
</tr>
</thead>
<tbody>
<tr>
<td>±10 V</td>
<td>-10.92 V</td>
<td>+10.92 V</td>
<td></td>
<td>0.333 mV</td>
</tr>
<tr>
<td>±10 mA</td>
<td>-10.92 mA</td>
<td>+10.92 mA</td>
<td></td>
<td>0.333 µA</td>
</tr>
<tr>
<td>4–20 mA</td>
<td>+3.262 mA</td>
<td>+20.74 mA</td>
<td></td>
<td>0.267 µA</td>
</tr>
</tbody>
</table>

Permissible Measurement Range of QAIO 2/2 analog inputs

Max. permissible continuous overload (higher load results in damage)
±36 V on voltage inputs
±36 mA on current inputs (or ±6.4 V without current limiting)

Digital resolution
16 bit

Data format in the application program
32 bit floating point

Output values when below or above measurement range
Maximum or minimum values: see “Permissible Measurement Range”

Conversion method
Successive approximation

Duration of conversion per input
Typ. 12.5 µs

Sampling time
The sampling time corresponds to the task interval of the application program that reads the input. All 2 analog inputs are sampled continuously in succession, i.e., every analog input is updated every 25 µs (max. 2 inputs à 12.5 µs of conversion time). The most recent value is used in the application program.

The task interval (and thereby the sampling time of the inputs) is set in the task configuration of the MACS development environment.

Protective device
Diodes

Recommended cable types
Use only shielded cables. The shield must be made of copper braiding with at least 80% coverage. The wire must be made of copper with a cross section of at least 0.25 mm² (23 AWG). In environments with a high amount of disturbance, use cables with twisted pair wires.

Calibration
The QAIO 2/2 is calibrated at the factory and does not require any additional calibration.

Crosstalk between inputs
<0.02%
5.3 Connecting Analog Sensors

Recommended cable types
Use only shielded cables. The shield must be made of copper braiding with at least 80% coverage. The wire must be made of copper with a cross section of at least 0.25 mm² (23 AWG). In environments with a high amount of disturbance, use cables with twisted pair wires.

Connecting a Non-Isolated Analog Sensor (Current Signal) with the Same Auxiliary Energy Connection as the QAIO 2/2
Connecting a Non-Isolated Two Wire Analog Sensor (Voltage Signal) with the Same Auxiliary Energy Connection as the QAIO 2/2

Connecting a Non-Isolated Two Wire Analog Sensor (Current Signal) with the Same Auxiliary Energy Connection as the QAIO 2/2

5.3.4 Using the Internal Reference Voltage of the QAIO 2/2

Connecting a Potentiometer to the QAIO 2/2 Using the Internal Reference of the QAIO 2/2
Connecting an Analog 4-Wire Sensor to the QAIO 2/2
Using the Internal Reference Voltage of the QAIO 2/2
6 Pulse Input

6.1 Operation of digital inputs of QAIO 2/2:

To use any digital input of the QAIO 2/2, the analog inputs of the module must be disabled. Both digital channels of the QAIO 2/2 are used as pulse counting inputs. In this mode only one of the two inputs can be active. The configuration can be done completely with the MACS software of the E-Bus master module.

6.2 Hardware:

6.4 Pulse frequency

Pulses with a minimum pulse width of 200ns (5MHz) are detected by the electronics. The counter register value is incremented by 1 at any occurrence of a falling edge at the digital input in use.

6.5 Software

Configuration:
The configuration of the QAIO 2/2 is done by the E-Bus master module. For that purpose a QAIO 2/2 module must be placed as an E-Bus slave. To use any digital input, the operation mode „Analog input“ has to be changed to „Pulse counter“ or „Frequency measurement“. In both cases the QAIO 2/2 works as a pulse counter. The calculation of the frequency is done by the E-Bus master module. The time base for this calculation is the cycle time of the task with the highest priority.
6.6 Usage constraints

When using QAIO 2/2 modules in a E-Bus chain, it is not possible to use QAIO 16/4 modules at the same time in the same E-Bus group. The MACS software avoids this and displays an error message.

When using QAIO 2/2 modules in combination with QDIO 16/16 modules in the same E-Bus group, it is necessary to use the QAIO 2/2 modules close to the E-Bus master and align the QDIO 16/16 modules on the right side of the E-Bus group.
